===== AETHERIUM UNIFIED FRAMEWORK - OPEN SOURCE SUPPLEMENTARY MATERIAL Author: Richard MORIN (GENIUS Activity) License: OpenRAIL-M / CC-BY 4.0

DESCRIPTION: This repository contains the supplementary Python (PyTorch) source codes and output visualizations for the "Master Paper" on the Aetherium Framework. These scripts provide the computational proof of concept for the continuous Gross-Pitaevskii-Poisson (GPP) dynamics and its application to Artificial General Intelligence (AGI).

FILES INCLUDED:

1. aetherium_holographic_agi.py
 - Description: Demonstrates the holographic memory capabilities of the Aetherium fluid. Shows Zero-Shot learning of complex topologies and the spontaneous reconstruction of corrupted memories (resolution of catastrophic forgetting) guided by Collatz topological viscosity.
 - Requirements: torch, numpy, matplotlib.
2. aetherium_mnist_reservoir.py
 - Description: High-performance demonstration of the Aetherium acting as a continuous Physical Reservoir Computer. Uses the GPP fluid to classify the MNIST dataset without backpropagation through the fluid.
 - Requirements: torch, torchvision, numpy, matplotlib.
3. Visualizations (*.png, *.jpg)
 - High-resolution outputs of the Cosmic Web genesis and the AGI Holographic recall process.

USAGE: Run the scripts directly in a standard Python 3 environment. CUDA/MPS acceleration is automatically supported if available. Example: \$ python aetherium_holographic_agi.py

CITATION: If you use these codes in your research, please cite the main paper: "The Aetherium Unified Framework: A Topological Gross-Pitaevskii-Poisson Solution for the Dark Fluid Conjecture and Macroscopic Quantum Coherence" by Richard Morin.
